**5 Additional tables****5.1 Input characteristic curve**

Current depending on the input voltage and the ambient temperature $T_A$			
Supply voltage [V]	Input current [mA]	Input current for $t \geq 20$ s [mA]	
		$T_A = 25^\circ\text{C}$	$T_A = 55^\circ\text{C}$
18	3.0	2.9	2.5
24	3.9	3.8	3.5
30	4.5	4.2	3.0

The current is reduced depending on the ambient temperature and the number of inputs that are switched on (internal module temperature).

**5.2 Power dissipation****Formula for calculating the power dissipation of the electronics**

$$P_{EL} = 0,525 \text{ W} + \sum_{i=1}^n (U_{INi} \times 0,003 \text{ A})$$

Where:

$P_{EL}$  Total power dissipation in the terminal  
 $i$  Continuous index

$n$  Number of set inputs ( $n = 1 \dots 16$ )  
 $U_{INi}$  Input voltage of input i

**Power dissipation of the housing**

2.8 W, maximum (within the permissible operating temperature)

**5.3 Limitation of simultaneity, derating**

No limitation of simultaneity, no derating

## 8 Connection notes and examples

### NOTICE Malfunction

The supply voltage  $U_S$  is used internally as the auxiliary supply. If it is not present, the terminal will not operate properly. Make sure that the supply voltage  $U_S$  is available.

When connecting the sensors observe the assignment of the terminal points to the process data.
